                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW19990 represents a protein that has interleukin-1 receptor (IL-1-R) intracellular ligand activity. IL-1-R intracellular ligand proteins seed to screen for agents (and the ligand proteins) that are capable of inhibiting or blocking the binding of an IL-1-R, intracellular ligand to the intracellular domain of IL-1-R, i.e. inhibitors of IL-1 activity. Such agents can be used to treat inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel human membrane spanning proteins (MSPs), and the polynucleotides encoding them. The products of the invention are used to diagnose, prevent and treat neoplastic, immunological and reproductive disorders. This sequence represents the human membrane spanning protein MSP-5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1999-551409/46.

The polynucleotides are useful as a marker of atherosclerosis, which may be used: (i) in the diagnosis, prevention and treatment of atherosclerosis; (ii) as serum/plasma markers to screen patients at risk for plaque instability to evaluate the effects of other treatments; (iii) in the preparation of vector molecules for the expression of the encoded protein in host cells; and (iv) in the polynucleotides, the encoded proteins or analogues of the gene. The polynucleotides, the encoded proteins or antibodies against the proteins may be used to target other therapeutics to an unstable plaque.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of a polynucleotide differentially expressed in ruptured and atherosclerotic plaques as a maker for atherosclerosis, useful ir treating, diagnosing or preventing atherosclerosis:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulation of the expression of the polynucleotide can increase plaque stability and therefore inhibit the progression of atherosclerotic cardiovascular disease. Modulators may be used to prepare pharmaceuticals for atherosclerotic disorders. The present sequence represents a membrane

                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel human secreted proteins CC (ABR47633-ABR48145) and their coding sequences (ACC50344-ACC50856). The CC proteins and their coding sequences are useful for the preparation of a CC diagnostic or pharmaceutical composition for diagnosing or treating a CC cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary arteriosclerosis and myocardial ischaemia), neural disorders, coronary atteriosclerosis and myocardial ischaemia), neural disorders, coronary atteriosclerosis, muscular disorders, real disorders, coronary attention disorders, pulmonary disorders, renal disorders, coronary attention disorders, pulmonary disorders, renal disorders, coronary disorders, renal disorders, coronary disorders and conditions for treating or coronary disorders and epithelial cell prollferation, to treat inflammation or infection, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or neurodegenerative conditions such as Alzheimer's disease and Parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue coronary attention and differentiation of haematopoietic cells and bone marrow cells when used in combination with other cytokines, to maintain corporation stem cells, or to modulate mammalian characteristics or matching stem cells, or to modulate mammalian characteristics or

                                  the use of the secreted proteins in drug screening, and recombinant vectors and host cells comprising a nucleic acid of the invention. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, oesophagus, stomach, small intestine, large intestine, liver, biliary tract and pancreas, and include cancers of these organs and tissues. The secreted proteins and their nucleic acids may also be used in the
                                                                                                                                                                                                       protein genes, and ABP00011-ABP00299 represent the proteins they encode. ABZ71479-ABZ71540 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins,
                                                                                                                                                                                                                                                                                                 Claim 13; Page 1038-1041; 1216pp;

The polypeptide and the nucleic acid are useful for treating breast cancer, and diagnosing or monitoring the presence of metastases of breast cancer in a patient. The polypucleotides of the invention can be used to treat disorders by gene therapy. This sequence represents a breast specific related polypeptide of the

CDK4 binding proteins (CDK4-BP) may be used in an assay for screening test compounds as inhibitors of CDK/CDK4-BP interaction. The complexes formed by CDK4 and D-type cyclins are strongly implicated in the control of the early cliphase of the cell cycle and are strong candidates for controlling and/or preventing tumourigenesis and the onset of cancer. Nucleic acids encoding CDK4-BP or fragments of these may be used as probes/primers to diagnose the presence or absence of genetic lesions in a gene encoding 1 of the 24 CDK4-BP, and hence to diagnose the risk for a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTs (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures because of ESTs from different intersice.

AAB6322 to AAB63467, AAB63468 to AAB63721 and AAB6372 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g. cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,
                                                                                  AIDS-related complex; chondrocyte growth; bone regeneration; periodontal regeneration; tissue transport; bone graft; skin aging; keratinocyte growth; hair loss; melanocyte growth; cell proliferation; cell growth; organ transplant; cell differentiation; body height; weight; hair colour; eye colour; skin; percentage of adipose tissue; pigmentation; cosmetic surgery; metabolism; biorhythm; caricadic rhythm; depression; tendency for violence; pain; reproductive capability; hormone level; endocrine level; appetite; libido; memory; stress; storage capability; fat content; lipid content; protein content;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
marrow cells when used in combination with other cytokines; maintains organs before transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early embryos; increases or decreases the differentiation or proliferation of embryonic stem cells, besides, haematopoietic lineage; modulates mammalian characteristics, such as, body height, weight, hair colour, eye colour, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic surgery); modulates mammalian metabolism; changes mammal's metal state or physical state by influencing biorhythms, caricadic rhythms, depression, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appetite, libido, memory, or stress; increases or decreases storage capabilities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for detecting disorders, e.g., cancer or cancer metastases, in animals or humans. The nucleic acid: stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries, and other cardiovascular conditions; treats wounds due to injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transports or bone grafts; prevents skin aging due to sunburn by stimulating keratinocyte growth; prevents half loss, since FGF family members activate hair-forming cells and promotes melanocyte growth; stimulates growth and differentiation of hematopoietic cells and bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AIDS-related complex; stimulates chondrocyte growth, thus they can used to enhance bone and periodontal regeneration and aid in tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and limb regeneration; stimulates neuronal growth; can treat and proneuronal damage occurring in certain disorders or neurodegenerative
Gene #12 associated peptide #1.
                                                                               24-APR-2001 (first entry)
                                                                                                                                                                                                                                                 AAB80430 standard; peptide; 505 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          printed specification, but water the US patent office at

"Hypoxia-specific upregulation of calpain activity and gene expression in pulmonary artery endothelial cells.";
Am. J. Physiol. 275:L461-L468(1998).
-!- FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction (By similarity).
-!- CATALYTIC ACTIVITY: Preferential cleavage: Tyr-l-Xaa, Met-l-Xaa, M-g-l-Xaa with Leu or Val as the P2 residue.
-!- COFACTOR: Binds 3 calcium ions.
-!- ENYIME REGULATION: Activated by 200-1000 micromolar concentratic of calcium and inhibited by calpastatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P43367;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction (By similarity) CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Arg-|-Xaa with Leu or Val as the P2 residue.

COFACTOR: Binds 3 calcium ions.

ENZYME REGULATION: Activated by 200-1000 micromolar concentrations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (regulatory) subunit.
SUBCELLULAR LOCATION: Cytoplasmic; Translocates
membrane upon Ca++ binding.
SIMILARITY: Contains 5 EF-hand calcium-binding
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        European

Calpain Z, large [catalytic] subunit precursor (EC 3.4.22.17)

(Calcium-activated neutral proteinase) (CANP) (M-type) (M-cal;

(Calcium-arr-calpain) (80 kDa M-calpain subunit) (CALP80).
                                                                                       TISSUE=CNS;

"Cloning of m-calpain from mouse nervous system.";
Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databbases.
-!- FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction (By similarity).
-!- CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-xaa, Met-|-xaa Arg-|-xaa with Leu or Val as the P2 residue.
-!- COPACTOR: Binds 3 calcium ions.
                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.
